

The genus Crumenaria (Rhamnaceae, Gouanieae)

Roberto D. Tortosa, Adriana Bartoli & Leonor Cusato

Abstract

TORTOSA, R. D., A. BARTOLI & L. CUSATO (2013). The genus Crumenaria (Rhamnaceae, Gouanieae). *Candollea* 68: 267-277. In English, English and French abstracts.

A synopsis of the genus *Crumenaria* (*Rhamnaceae, Gouanieae*) is carried on and four species are recognized. Each species is described and illustrated, with the comprehensive synonymy and typification. The names *Crumenaria choretroides* Reissek, *Crumenaria erecta* Reissek, *Crumenaria glaziovii* Urb., *Crumenaria lilloi* Suess., and *Crumenaria polygaloides* Reissek are lectotypified. A key and a distribution map of the genus are provided.

Key-words

RHAMNACEAE – GOUANIEAE – *Crumenaria* – Central America – South America – Taxonomy

Résumé

TORTOSA, R. D., A. BARTOLI & L. CUSATO (2013). Le genre Crumenaria (Rhamnaceae, Gouanieae). *Candollea* 68: 267-277. En anglais, résumés anglais et français.

Un synopsis du genre *Crumenaria* (*Rhamnaceae, Gouanieae*) est proposé avec quatre espèces reconnues. Chaque espèce est décrite et illustrée, avec sa synonymie et la typification de tous les noms. Les noms *Crumenaria choretroides* Reissek, *Crumenaria erecta* Reissek, *Crumenaria glaziovii* Urb., *Crumenaria lilloi* Suess. et *Crumenaria polygaloides* Reissek sont lectotypifiés. Une clé et une carte de répartition du genre sont fournies.

Address of the authors: Laboratorios de Botánica “L. R. Parodi”, Facultad de Agronomía, Universidad de Buenos Aires, Av. San Martín 4453, C1417DSE Buenos Aires, Argentina. E-mail (RDT, Consejo Nacional de Investigaciones Científicas y Técnicas): tortosa@agro.uba.ar

Submitted on February 25, 2013. Accepted on September 27, 2013.

Edited by P. Perret

Crumenaria Mart. is a genus of *Rhamnaceae* from Central and South America (Fig. 1-2), notable for the herbaceous habit, including annual and perennial herbs, in which the flowers have inferior ovary and the fruits are 3-seeded schizocarps, with winged membranous diaspores. For the characters of flowers and fruits, it is accommodated in the tribe *Gouanieae* Endl. (RICHARDSON & al., 2000), with the genera *Alvimiantha* Grey-Wilson, *Gouania* Jacq., *Johnstonalia* Tortosa, and *Reiskeia* Endl., all them with vine habit.

MARTIUS (1826-1827) established the genus based on a slender annual herb from Brazil, *Crumenaria decumbens* Mart. Later, several species, varieties and forms were described in the genus by REISSEK (1861), URBAN (1898), CHODAT & HASSLER (1903), HASSLER (1915), SUESSENGUTH (1939), and STANLEY (1940).

SUSSSENGUTH (1953) recognized 6 species for the genus *Crumenaria*: the type species, *C. decumbens*, *C. choretroides* Reissek (with *C. erecta* as a synonym), *C. diffusa* Suess., *C. glaziovii* Urb., *C. lilloi* Suess., and *C. polygaloides*. TORTOSA & al. (2013), before the treatment of the *Rhamnaceae* for “Flora del Paraguay” (CUSATO & TORTOSA, 2013), provided a comprehensive synthesis on the typification of the numerous names published by CHODAT (1903) and HASSLER (1915) and their taxonomic value.

In the present synopsis we recognize 4 species in the genus, one annual and the other three perennial.

***Crumenaria* Mart., Nov. Gen. Sp. Pl. 2: 68. 1826.**

Type species: *Crumenaria decumbens* Mart.

Annual or perennial herbs, leafy or almost leafless; leaves alternate, with stipules. Inflorescence a 1-14 flowered umbel, terminal or axilar. Flowers pedicellated, with campanulate or turbinate-campanulate floral tube. Calyx with 5 sepals triangular, erect. Petals 5, cucullate, clawed, erect. Disc absent. Stamens opposite and hidden within the petals, with thread-like filaments with curved apex, anthers dorsifixed, cordate, obtuse, with 2 loculi, and lateral-longitudinal dehiscence. Ovary inferior, obconic, trilocular, with solitary ovules in each loculus; style included or exserted, 3-toothed or divided in three branches; stigma obtuse. Fruit 3-seeded schizocarps, with winged membranous diaspores. Seeds obovate, dorsally convex, ventrally angled, tegument corneous, lustrous, endosperm thin, cotyledons elliptic, compressed, radicle very short.

Key to the species of *Crumenaria*

1. Inflorescence axillary 2
- 1a. Inflorescence terminal. Perennial rhizomatous herbs 3
2. Annual herbs. Flowers solitary or paired ... *C. decumbens*
- 2a. Perennial herbs, with rhizome and xylopodium. Flowers grouped 4 to 8 *C. glaziovii*
3. Floral tube glaber. Plants with junciform-polygonoid habit, with scale-like or small linear leaves *C. erecta*
- 3a. Floral tube pubescent. Plants with leaves ovate to broadly elliptic *C. lilloi*

1. *Crumenaria decumbens* Mart., Nov. Gen. Sp. Pl. 2: 69. 1827 (Fig. 1-3).

Typus: BRAZIL. Piauí: Oeiras, Ilha, s. coll., s.d., (holo-: M [M0147083] digital image!).

= *Crumenaria diffusa* Suess. in Lilloa 4: 134. 1939.

Typus: Ceará: Cedro, VI.1933, Luetzelburg 25788 (holo-: M, digital image!) **syn. nov.**

= *Crumenaria steyermarkii* Standl. in Publ. Field Mus.

Nat. Hist., Bot. Ser. 22: 156. 1940. **Typus: Jutiapa:** plains and swampy ground along railroad between Agua Blanca and Amatillo, 950-, 24.X.1939, Steyermark 30448 (holo-: F [F0068132F], digital image!; iso-: NY [NY00233279!]!) **syn. nov.**

Slender annual leafy herb up to 30(-50) cm, with thin roots. Stems erect or decumbent, subangled, striate, ca. diam., much ramified, with sparse, appressed hairs. Leaves membranous; stipules linear-elliptic, 1- long, apex acute, margin ciliate; petiole glaber or pubescent 2-; blade ovate, elliptic ovate, or subtriangular, 1- × 1-, margin entire, subcrenate, or with minute teeth, ciliate, base cordate, apex somewhat obtuse or acuminate, mucronate, 3(-5)-nerved at the base, adaxial surface glaber, abaxial surface with appressed hairs on the nerves. Inflorescences axillary, 1-2 flowered; peduncles 6-20mm, glaber. Flowers white; pedicels 1-, glabrous or pubescent, receptacle with long, thin, rigid appressed hairs; floral tube turbinate-campanulate, 1- long, glaber; sepals 0.8- long; petals 0.6- long; stamens with filaments 0.3- long and anthers long; style single or divided. Fruit 4- long × broad, surface with sparse hairs, apex scarcely emarginate, margin ciliate.

Iconography. – MARTIUS (1826-1827): tab. 160 and Figure 3.

Distribution and habitat. – *Crumenaria decumbens* has been collected in Bolivia (JØRGENSEN & al., 2013), Brazil (TORTOSA, 2008; de LIMA, 2010), Guatemala (STANLEY & STEYERMARK, 1949), and Honduras (MOLINA, 1975), in sandy or rocky soils, in margin of subhumid forests, and as a weed in cornfields and roadsides, at elevation from 300 to 900 m.

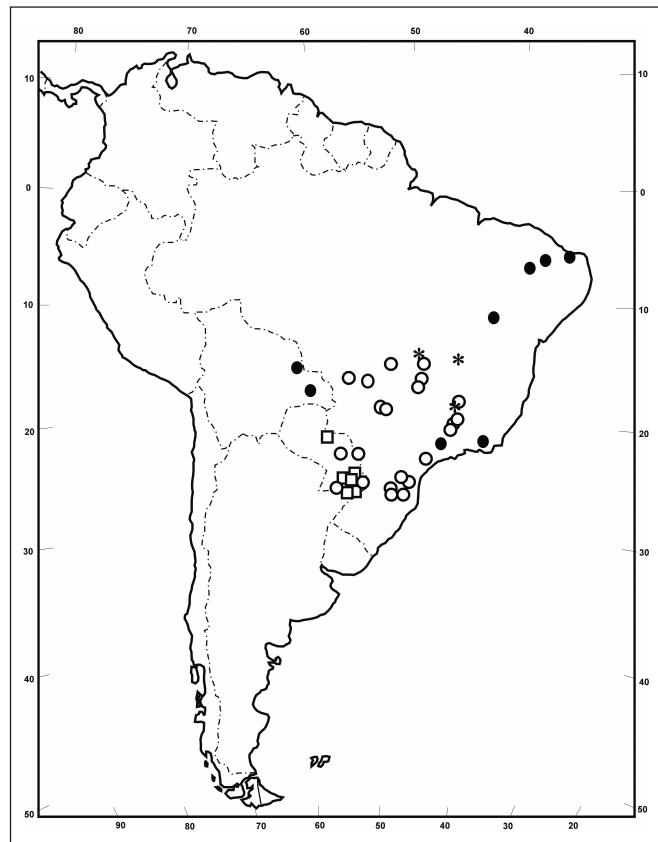

Fig. 1. – Geographic distribution of *Crumenaria decumbens* Mart. (●) (South American specimens); *C. erecta* Reissek (○); *C. glaziovii* Urb. (*); *C. lilloi* Suess. (□).

Phenology. – *Crumenaria decumbens* flowers from August to May.

Etymology. – The name of *C. decumbens* is taken from its decumbent habit.

Discussion. – *Crumenaria decumbens* is a quite distinct slender annual herb, different from the other species of the genus, which are perennial. Its roots smell like menthol (Abbott 16283 and Abbott & Mostacedo 16078).

Crumenaria diffusa and *C. steyermarkii* match all the diagnostic characters of *C. decumbens*, although the stems are more erect in the type of *C. diffusa* and leaves are slightly wider in that of *C. steyermarkii*.

Additional specimens examined. – **BOLIVIA. Santa Cruz:** Chiquitos, Roboré, E of Roboré River and N of Avenida del Ejército and railroad track, 4.II.1995, Abbott & Mostacedo 16078 (BAA, NY). **Ñuflo de Chavez:** Lomerio, ca. south of Concepción to Las Trancas community, then ca. to north on access “road”, 21.II.1995, Abbott 16283 (MO, digital image); camino de Concepción a San Antonio de Lomerio, a SE de Concepción, 23.I.2004, Sili Neffa & al. 1177 (CTES).

Cordillera: in valle fluminis Y-acá in campis pr. Valenzuela, I.1900, Hassler 6937 (holo-: G [G00228941!]!) (synonymized by TORTOSA, 2008).
- = *Crumenaria choretroides* var. *hirtella* Hassl. in Repert. Spec. Nov. Regni Veg. 14: 165. 1915. **Typus: Amambay:** Sierra de Amambay in campis arenosis Esperanza, IX.1907-1908, Hassler & Rojas 10637 (holo-: G [G00228939!]!) (synonymized by TORTOSA, 2008).

Perennial, almost leafless *herb*, 30-, with a ligneous rhizome, ca. diam. *Stems* erect, terete and striate, or subangled, 0.1- diam., much ramified at the base, glaber or with short hairs. *Leaves* scale-like or linear-elliptic, lesser than long, with stipules linear, briefly petiolate, blade 1-3-nerved, margin entire, glaber or with long sparsely pubescent hairs on both surfaces. *Inflorescences* terminal, ramified, each branch 2-, ending in a 2-14 flowered umbel. *Flowers* white, with pedicels 3-, glaber or scarcely pubescent; receptacle glaber or loosely hirsute; floral *tube* campanulate, 2- long, glaber; *sepals* 0.7- long; *petals* ca. long; *stamens* with filaments long and anthers long; *style* long, divided at the apex. *Fruit* 6- long × 5.5- broad, reticulate, glaber.

Iconography. – REISSEK (1861): tab. 41 and Figure 4.

Distribution and habitat. – *Crumenaria erecta* has been collected in the south of Brazil and east of Paraguay (TORTOSA, 2008; de LIMA, 2010; CUSATO & TORTOSA, 2013), at elevations from 500 to 1300 m.

Phenology. – *Crumenaria erecta* flowers from August to May.

Etymology. – The specific epithet of *C. erecta* is taken from its erect habit.

Discussion. – The priority of *C. erecta* and the treatment of some Paraguayan taxa by HASSLER (1915) are discussed by TORTOSA & al. (2013). *Crumenaria erecta* differs from the other species of the genus by its almost leafless habit. Some specimens of this species show fasciation in the stems; *C. choretroides* was based on two of such gatherings (see also Glaziou 20850, Hassler 10637, Irwin 7944, and Weddell s.n.).

We choose as lectotype of *C. erecta* one of the specimens at BR, which matches the protologue, and for *C. choretroides* the syntype from Serro de Frio at M which is representative of this taxon. In the case of *C. polygaloides*, the type specimen at B (negative at F [barcode] F0BN005862 digital image!) was destroyed during World War II, so we choose as lectotype the isotype at US.

REISSEK (1861) differentiated *C. erecta*, *C. choretroides*, and *C. polygaloides* by the pubescence (glaber or pubescent) and the section (terete, compresed, or fasciated) of stems, the size of leaves, and the number of flowers of the inflorescences, all characters variable within this taxon.

Additional specimens examined. – BRAZIL: s.l., Glaziou 20850, [sub nom. *Crumenaria angulata* URBAN (C, photo NY!). Brazil Central, no date, Weddell s.n. Fig. 3. – *Crumenaria decumbens* Mart.

[Abbot & Mostacedo 16078, BAA] [Drawn by Norma Valgañon]

3. *Crumenaria glaziovii* Urb. in Bot. Jahrb. Syst. 25, Beibl. 60: 1. 1898 (Fig. 1, 5).

Lectotypus (designated here): **BRAZIL. Goiás:** inter Cabeceiras do Rio Sambambaia et Le Pouzo de Barbatimao, Glaziou 20848 (BR [BR0000005314171] digital image!; iso-: K [K000531970] digital image!, R [R000074467] digital image!, S [S-R-9570] digital image!).

Perennial herb, 10-, with rhizome and xylopodium. Stems spreading, terete, striate, 0.5- diam., with short hairs. Leaves with stipules elliptic; 3- long; petiole 1.5- long; blade broadly elliptic or elliptic, 1-2.5 × 0.5-, margin entire, apex apiculate, adaxial surface glaber, abaxial surface glaber or with appressed hairs on the nerves. Inflorescences axillary, 4-8-flowered, peduncles 3.5- long. Flowers white, with pedicels 1-, pubescent; receptacle with rigid appressed hairs. Floral tube campanulate, long, glaber; sepals ca. long; petals ca. long; stamens with filaments long and anthers long; style ca. divided at the apex. Fruit not seen.

Distribution and habitat. – *Crumenaria glaziovii* grows in grazing areas of the states of Goiás and Minas Gerais of Brazil (de LIMA, 2010), at elevations from 600 to 1050 m.

Phenology. – *Crumenaria glaziovii* flowers in October and November.

Etymology. – *Crumenaria glaziovii* was named in honor of Auguste François Marie Glaziou (1828-1906), a French botanist and landscape designer, who collected the type specimen.

Discussion. – *Crumenaria glaziovii* is related to *C. decumbens* with which it shares axillary inflorescences and slender stems, but differs in its perennial habit.

The holotype at B (negative at F [barcode] F0BN005861 digital image!) was destroyed during World War II; we choose the isotype at BR as lectotype which matches the diagnostic characters.

Additional specimens examined. – **BRAZIL. Goiás:** Chapada dos Veadeiros, ca. N.W. of Veadeiros, road to Cavalcante, 22.X.1965, Irwin & al. 9478 (NY). **Minas Gerais:** Sacramento, Parque Nacional da Serra da Canastra, estrada São Roque de Minas - Sacramento, da Portaria de São Roque de Minas, 7.XI.2002, Pontes & al. 535 (NY).

San Pedro: in campis siccis in regione cursus superioris fluminis Apa, XII.1901-1902, Hassler 8271 (lecto-: G [G00228952]!) (synonymized by TORTOSA, 2008).

Perennial leafy herb, 20-, with a ligneous rhizome, 0.5-diam. Stems erect or decumbent, terete and striate, or subangled, 0.1- diam., ramified at the base, with short hairs. Leaves with stipules elliptic, 0.3- long, pubescent; petiole 1.5-; blade ovate or broadly-elliptic, 3- long × 1.2- broad, apex subacute or obtuse, base obtuse, margin entire or crenate-serrate, pubescent on both surfaces or with the upper epidermis glaber and the basal epidermis with hairs on the nerves. Inflorescence terminal, peduncle 3.5- long, sometimes ramified, with branches ca. 0.5- long, ending in 4-9-flowered umbels. Flowers white or yellowish, with pedicels 3-; receptacle pubescent; floral tube campanulate, long, pubescent; sepals ca. long; petals ca. long; stamens with filaments long and anthers long; style long, 3-divided at the apex. Fruit 0.6- long × 0.8- broad, reticulate, glaber.

Distribution and habitat. – *Crumenaria lilloi* grows in grasslands in Paraguay, South Brasil and NE of Argentina (TORTOSA, 2008; CUSATO & TORTOSA, 2013), at elevations from 120 to 320 m.

Phenology. – *Crumenaria lilloi* flowers from September to March.

Etymology. – *Crumenaria lilloi* was named in honor of Miguel Lillo (1862-1931), Argentine botanist and naturalist.

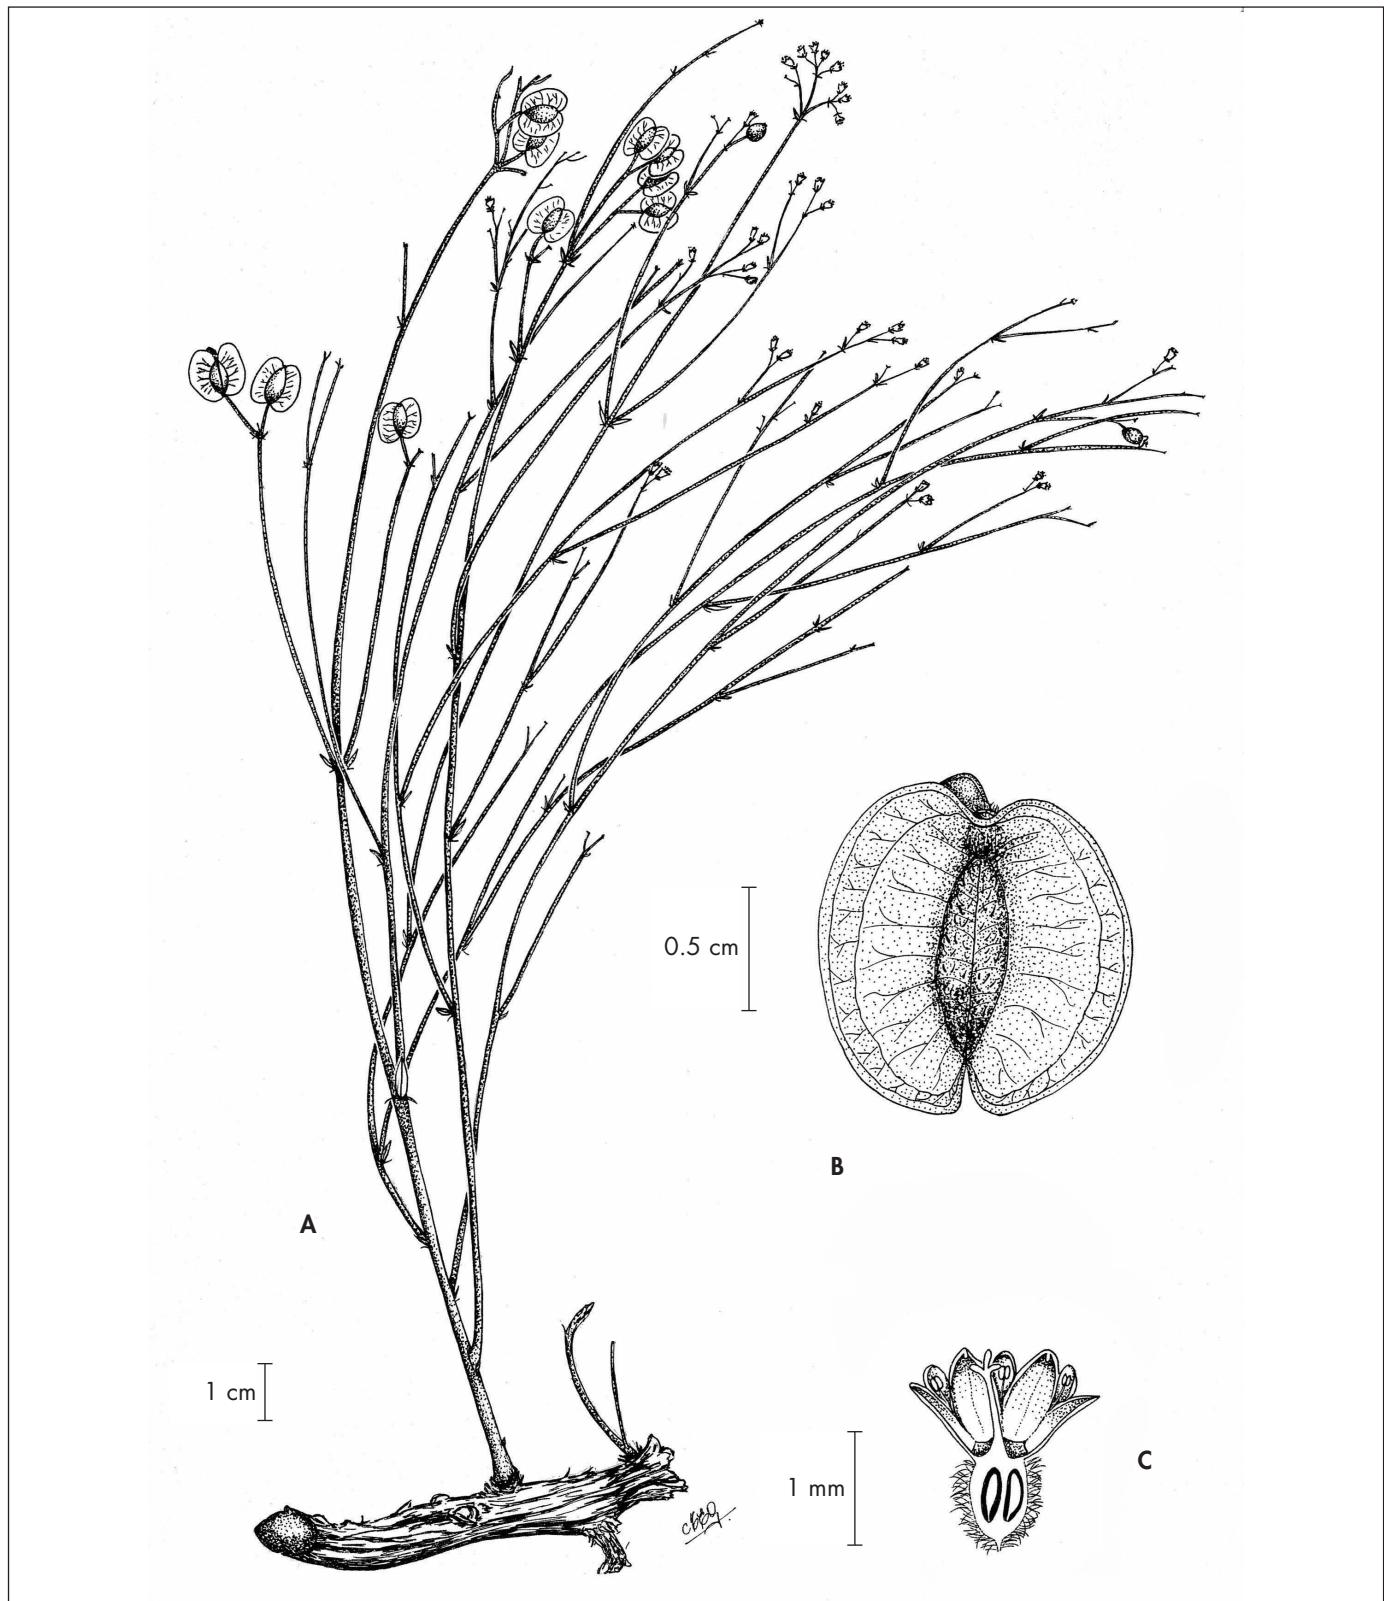

Fig. 4. – *Crumenaria erecta* Reissek. A. Habit; B. Fruit; C. Flower.

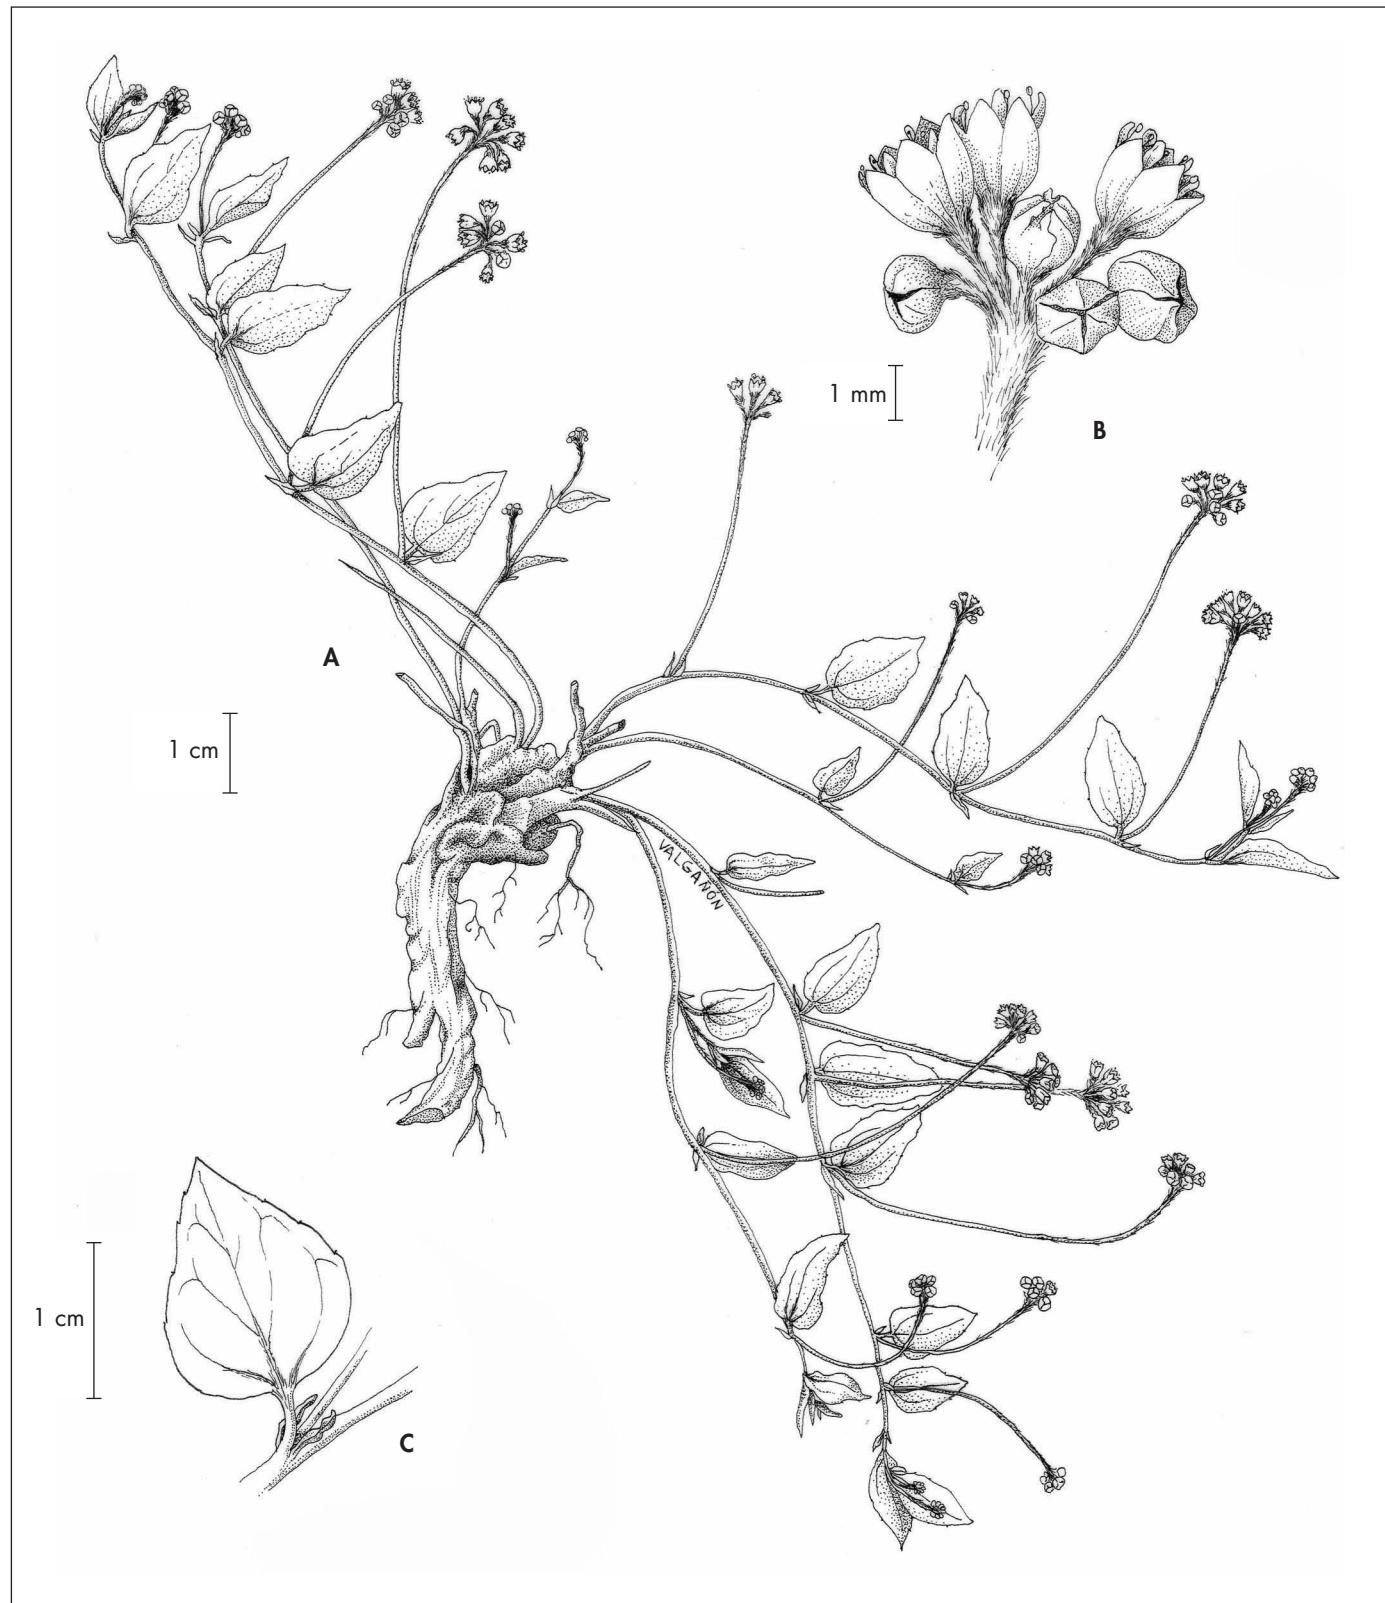

Fig. 5. - *Crumenaria glaziovii* Urb. **A.** Habit; **B.** Flower.
[Pontes 535, NY] [Drawn by Norma Valgañon]

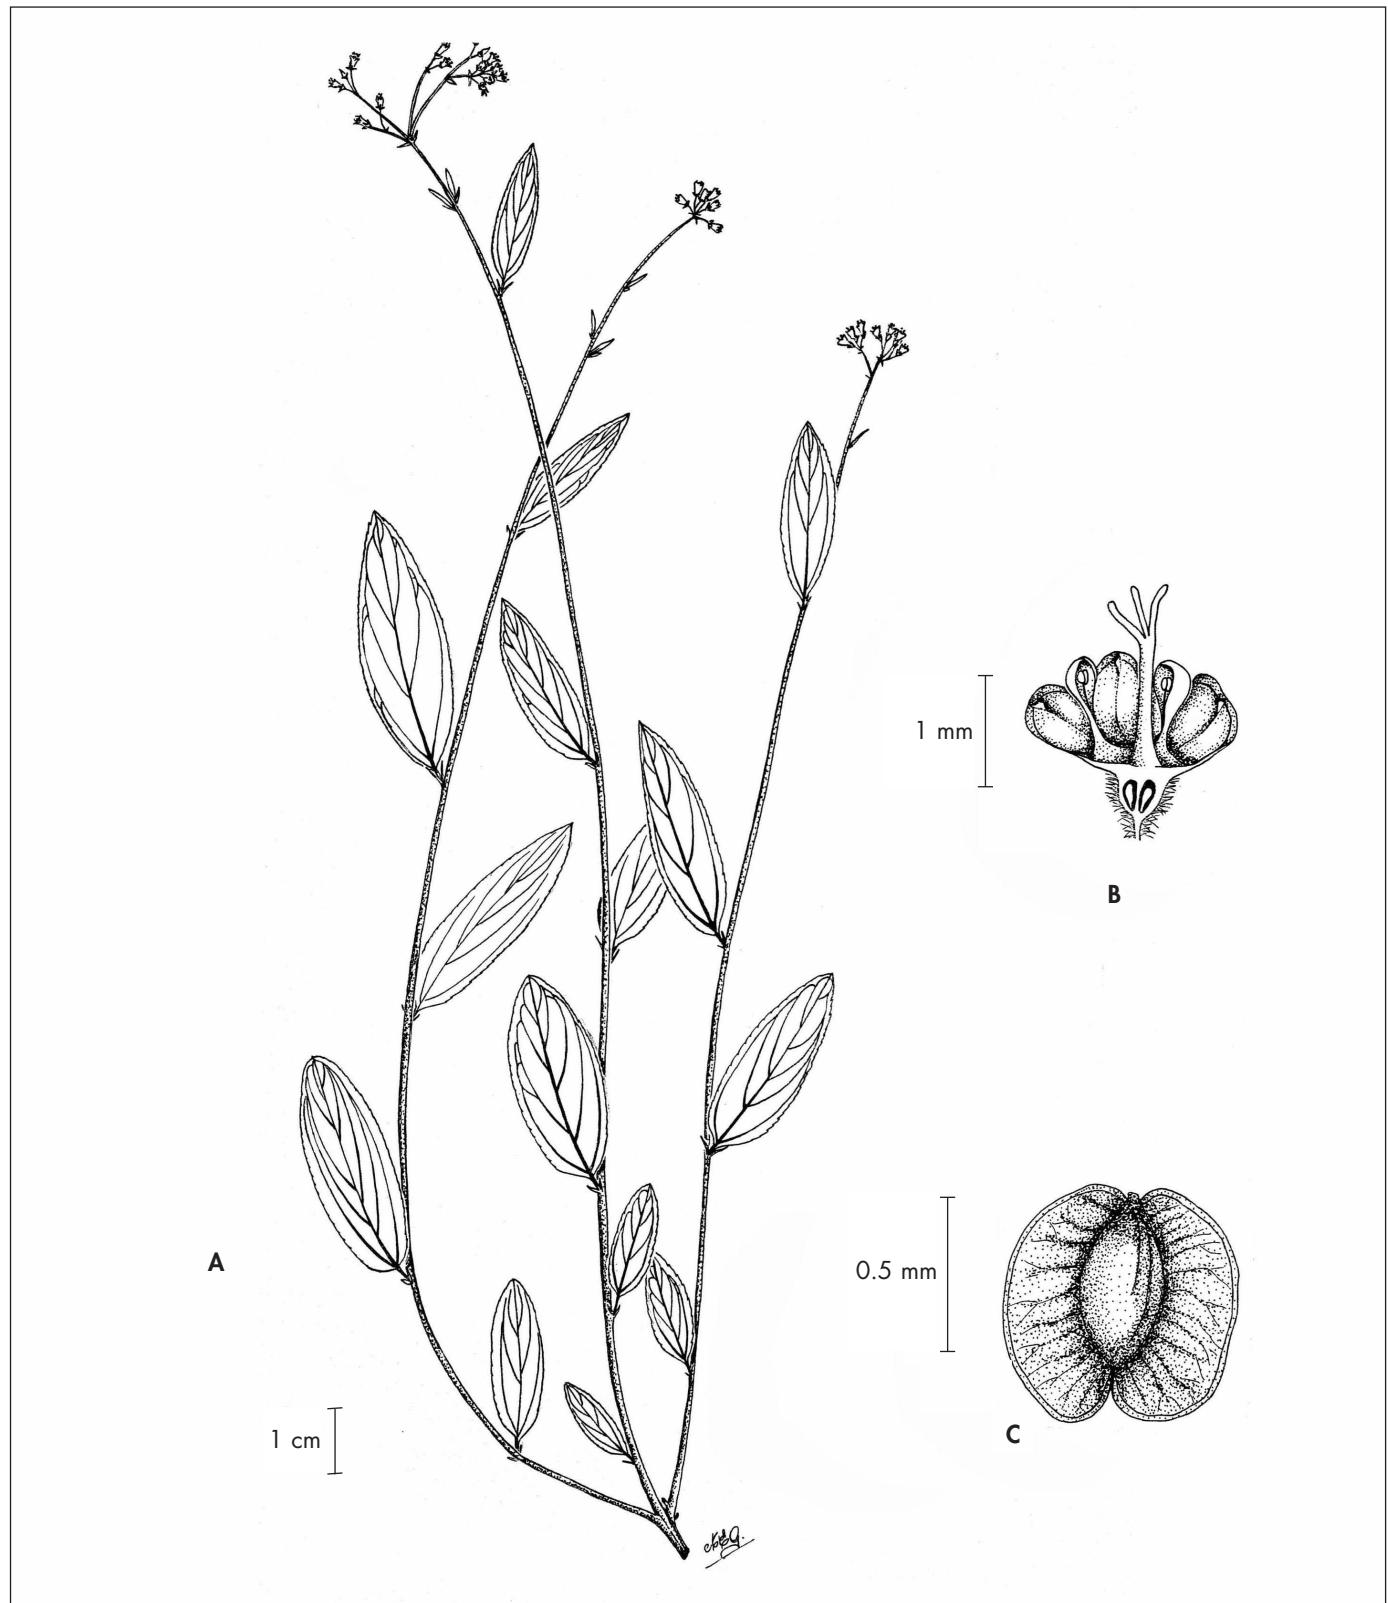

Fig. 6. - *Crumenaria lilloi* Suess. A. Habit; B. Fruit; C. Flower.
[A-B: Hassler 8271, G; C: Hassler 4549, G] [Drawn by María Eugenia Gallegos]

Discussion. – In the original description of *C. lilloi*, SUESSENGUTH pointed out that the materials on which he based his description were both at “herb. Munchen and Inst. Lillo, Tucumán”. We choose the specimen at M as lectotype because it is more complete (two fertile stems vs. one fertile stem and three sterile in the specimen at LIL).

CHODAT (1903), who studied the genus *Crumenaria* in Paraguay, considered that all the materials collected by Emil Hassler in that country belonged to the Brasilian species *C. polygaloides* (= *C. erecta*). On account of differences in the shape of leaves and in the general pubescence of the plants, he established three varieties and a form. Later, HASSLER (1915) tried a Paraguayan taxa's reappraisal of his own. A synthesis on the typification of the numerous names involved and their taxonomic value is presented by TORTOSA & al. (2013) before the treatment of the *Rhamnaceae* for “Flora del Paraguay” (CUSATO & TORTOSA, 2013).

Additional specimens examined. – **ARGENTINA. Corrientes:** Ituzaingó: Ituzaingó, Rincón Ombú Chico, 11.X.1980, Schinini 20932 (CTES); Ea.
